Winter Springs, Florida 32708

OPERATING INSTRUCTIONS:

SCORPION GOLD STINGER

ASSEMBLY INSTRUCTIONS

1. Compress the button ends of the spring clip and insert, button end first, into the lower stem of the detector so that the button ends pop out of the holes. This will enable the stem assembly to be attached to the electronic housing and the over all length of the detector adjusted for a comfortable operating length.
2. Two spring clips are installed at the factory in the upper metal stem for mounting the detector housing to the stem, if desired.
3. Attach the lower stem to the searchcoil by inserting the two rubber washers into the stem and slipping the searchcoil onto the stem. Insert the threaded bolt through the holes and hand-tighten the two knobs.
4. Install the upper stem to the lower and then this assembly to the detector housing by depressing the buttons and coupling the stem to the housing. Adjust for the most comfortable operating length.
5. Wrap the searchcoil cable snugly about the stem with the first turn of the cable over the stem.
6. Insert the cable connector into the connector on the detector housing and hand-tighten securely.

CONTROL FUNCTIONS

Familiarize yourself with the detectors controls. Their basic functions are given here. How they can help you find treasure is explained in the Operating Instructions of this Manual.

Power/ Depth:

- Turns the detector on;
- Turns the detector off;
- Regulates the detection depth.

Raise searchcoil approximately one foot above the ground. Rotate this knob to turn the detector on and the begin operating. Each time the detector is turned on the battery condition is reported audibly. Three or more tones indicate the batteries are very good, two tones indicate the batteries are adequate. One tone or no tone indicate the batteries need to be replaced.

Further rotation of this knob increases the detection depth and sensitivity.

Audio:

This 10-turn control on the lower left of the detector panel allows the operator to adjust precisely, the level of sound generated by the detector. It is suggested that this sound level be adjusted to a threshold level where it is barely audible when searching.

Ground Balance:

This 10-turn control on the lower right of the detector panel permits precise ground balancing of the detectors circuits in the All Metal mode, with the **Master Control Switch** set to the left in the All Metal position.

Calibrated Discrimination:

This control on the upper left of the panel offers full range discrimination capabilities when the detector is operating in the Motion Discriminate or TR discriminate modes. That is, the **Master Control Switch** is switched to either of these positions.

Auto/Manual Tune:

This toggle switch on the left between the Discrimination and Audio Controls selects Automatic or manual retuning of the audio threshold level established by the operator. (See Audio above).

Retune:

This push button near the lower right center of the panel permits the operator to retune the audio threshold level when the Manual tuning position is selected and you have changed various selector settings.

Master Control Switch:

This toggle switch located to the left of the retune pushbutton permits the selection of the desired operating mode. To the left, selects All Metal operation (with manual ground balancing). The Motion Discriminate Mode (switch to the right) offers automatic ground balancing and is primarily designed for coin hunting or other general searching, while the TR Discriminate mode (switch to the center) is primarily intended for ore sampling and high grading of samples.

Headphone Jack:

Located on the backside of the detector housing.

OPTIMUM AUDIO LEVEL

Automatic Tuning:

Turn the detector on and move the **Tuning** switch to the AUTO position. Rotate the **Audio** control until only a faint sound is heard. This is the optimum audio threshold level. The detector will now maintain this level throughout all operating conditions as long as the switch remains in the AUTO position.

Manual Tuning:

Turn the detector on and move the **Tuning** switch to the MANUAL position. Move the MASTER CONTROL SWITCH to either the All Metal or TR Discriminate mode. Push and hold the RETUNE Pushbutton. Rotate the Audio control to achieve a faint threshold of sound before releasing the Retune button. This establishes the audio Threshold level. In this position any change to control settings and some ground conditions may cause the audio level

to increase or decrease. To reacquire the threshold level of audio it will be necessary to press the pushbutton for about one second then release to return the audio to the preset level.

OPERATING INSTRUCTIONS

The detector has initial setting points indicated by arrows. By adjusting the controls to these points, after setting the audio, all adjustments for your hunting pleasure are fulfilled and further adjustments may not be necessary.

Discriminate Mode:

Move the Master Control Switch to the Motion Discriminate position (automatic ground balanced/trash elimination). When in this position only selected targets will be found. Setting the Discrimination control to higher levels can cause some rings and coins to be undiscovered. As you become more familiar with your detector you will remember rejection settings for various targets by the numbers around the control knob. Bench test the detector as detailed below.

Bench Testing:

This enables you to understand more fully the operation of the detector in the discriminate operating modes. Perform these tests with the searchcoil several feet away from any metallic object or surface.

- Rotate the discrimination control fully counterclockwise. Set the Master Control switch to the TR Discriminate position and the Tuning switch to Manual. Press the retune button for a second to re-establish the pre-selected audio threshold level. Pass selected targets past the searchcoil and notice that all targets give an audio response. This is true non-discriminating operation. You may also wish to test various rocks and ore samples at this position.
- Rotate the control to 3 or 4, press tune and repeat the test. Some items will now give no audio response or perhaps a decrease in audio. Press the pushbutton if necessary to regain your threshold audio level.
- Continue this test with various targets at higher discriminate settings and note where the trash items are no longer discovered.
- Now move the Master Control switch to the Motion Discriminate position and the Tuning switch to Automatic. Perform the same tests and note the results. You will notice that it will not be necessary to press the pushbutton to re-establish the audio threshold level after moving the discriminate control.
- Never rotate the Discrimination control any farther clockwise than necessary to eliminate targets you do not wish to detect.

All Metal Mode:

- Press the Master Control switch to the All Metal position. In this position the Scorpion will respond to all metallic or conductive targets presented to the searchcoil. For maximum depth and the best operation when prospecting or searching mineralized ground always operate in the All Metal mode.

Ground Balance:

Mineralization can be balanced (canceled out) by use of this control. To determine if adjustment is necessary, move the tuning switch in the manual position, press and release the retune pushbutton, and lower the searchcoil toward the ground stopping at about two inches

above the surface. Make certain that there is no metal beneath the searchcoil. **Listen for the FIRST audio response.** The sound can only increase, decrease or remain the same. If the sound does not change, no adjustment to the Ground Balance Control is necessary.

If the first sound is a decrease in sound, raise the searchcoil and rotate the Ground Balance control clockwise (increase) one or more complete turns. Press and release the pushbutton to retune and lower the coil toward the surface. Listen to the audio response. If the sound still decreases, repeat this adjustment. However, if the sound now increases, raise the coil, turn the control this time counterclockwise (decrease) one complete revolution, press and release the pushbutton, and lower the coil toward the surface.

Continue this process until there is little or no change in the audio level as the searchcoil is lowered to operating the operating height.

This is a 10-turn control so do not be hesitant about turning it. Because this is a 10-turn control proper ground balancing may require turning the control several revolutions. Remember to rotate the control clockwise when the sound decreases and counterclockwise when the audio sound increases. Press and release the pushbutton to retune after each change.

Searching:

Scan the searchcoil at a speed of about one to two feet per second at a distance from the ground of about one to two inches. An audio increase will indicate the presence of metal beneath the coil. (If in one of the discriminate modes, only accepted targets will give an audio response).

Pinpointing and Target Recovery:

When the detector locates a target you must recover it to see what has been found. Pinpoint the target by making an imaginary "X" over the target. Where the loudest sound is, the target will be beneath the searchcoil. You may wish to switch into the All Metal mode to enable you to hover over the target, because in the motion discriminate mode requires searchcoil movement to recognize the targets presence.

The final step is recovery and digging is usually involved. Always make as small a hole as possible and always fill your holes when the target has been recovered.

Batteries:

The Scorpion Gold Stinger requires three (3) 9-volt batteries. When replacements are required use only high quality carbon, alkaline or rechargeable batteries. Each time the detector is turned on the batteries are checked automatically and audibly. Three or more tones indicate the batteries are very good, two tones indicate the batteries are adequate. One tone or no tone indicates the batteries should be replaced.

Battery Replacement:

The batteries are located inside the electronic housing on the side of the chassis. To access the batteries, first disconnect the searchcoil and remove the housing from the stem, if so mounted. Then loosen by hand the knurled nut beneath the housing and remove the chassis from the housing. The batteries are beneath a protective clamp directly behind the control panel. Loosen the clamp and slide it off the batteries. Remove the old batteries and install the new ones. Be sure to observe the proper polarity of the batteries when installing the new batteries. Reassemble making certain that all parts fit snugly, but do not force the parts together.

SEARCHCOILS: The Scorpion Gold Stinger Has two searchcoils available for its use.

The 5 x 10" Elliptical DD Searchcoil, which provides excellent depth and good scanning width is the most popular size used by prospectors, coin hunters, and for general searching in all areas. This searchcoil should be used for your primary searching.

The 3 x 7" Elliptical DD Searchcoil offers the ability to recover precious ores in areas where the larger coil may not be used satisfactorily because of space and tight operating conditions. Electronic prospectors can quite effectively use this small coil when searching for nuggets.

Like wise those searching for coins and other valuable objects from areas with large amounts of buried metal trash or in areas adjacent to such metal as playground equipment, fences and metal buildings rely on this coil for success. Because of its small size it can detect fewer targets at a time and work in restricted areas. This eliminates the possible "masking" effect of junk targets.

PROFESSIONAL PHASE

COIN HUNTING: After studying this Owner's Manual very carefully, you will be able to perform more tasks with the detector and complete them more easily. The following tips represent the experience of a professional with the detectors.

Deep coin hunting: For maximum depth and to avoid missing a small or very old coin, search in the All Metal mode. This will prevent missing an especially old coin that is so oxidized that it will be rejected by any discrimination. Should the sound become erratic, reduce the detection depth until the sound levels out. You are now operating at the maximum sensitivity possible under present ground conditions.

Hunting in trashy areas: Use of Garrett's 3 x 7" Elliptical searchcoil can aid tremendously in the search for coins in areas with large accumulations of metal trash. Although any size searchcoil will perform in this arena, this searchcoil will produce the best results.

CACHE & RELIC HUNTING: Operating in the All Metal mode, attach the 5 x 10" Elliptical DD Searchcoil and increase DEPTH/Sensitivity for maximum sensitivity possible (without erratic sound). Scan the searchcoil approximately two to four inches above the ground (depending on ground conditions) to eliminate erratic responses from ground minerals and small bits of metal. You will have super sensitivity and detect all targets dime-sized and larger. Caches and relics previously missed or overlooked will now be detected easily.

ELECTRONIC PROSPECTING: Even though the Scorpion Gold Stinger detector is a universal detector, excellent for prospecting, its very low frequency (VLF) circuitry will not detect some microscopic gold.

Nugget Hunting: Using the large searchcoil, manually ground balance the detector slightly positive in relation to the ground. This condition makes detection of small nuggets easier since detectors that adjust slightly negative have a tendency to overlook the smaller nuggets.

Hot Rocks: The Scorpion Gold Stinger will instantly identify both types of “hot rocks” in any search area. Test for them in the following manner. Simply scan in the All Metal mode. When you locate a suspected hot rock, press the Master Control switch to Motion Discriminate, with the discrimination control turned fully counterclockwise, pass back over the target. If the target is a hot rock, it will not respond. If it has sufficient metal content, it will respond as metal. If it is a large gold nugget or non-ferrous metal, the audio will sound. Because small nuggets or other metallic targets sometimes produce no response in the Motion mode, it is advisable to use this method only to test suspected hot rocks that respond loudly and positively to All Metal scanning.

Searchcoil sizes will differ according to the area being searched. If the search area is in a dry wash or among large rocks that restrict the use of a large coil, change to the smaller size. When working in areas that have already been searched, your best option may be to change to the 5 x 10 Elliptical DD searchcoil. Extremely small nuggets may be missed with the larger coils, but the increased depth and sensitivity will permit you to detect deep nuggets that may have been previously missed. Professional nugget hunters know that one nugget of decent size is better than hundreds of microscopic ones.

Alkaline salt is heavily present in some rich nugget hunting areas. Attempts to search such areas with metal detectors have met with failure over the years because of the difficulty in ground balancing. However, by using the DD searchcoils and a relatively low level of discrimination, salt is usually ignored and large nuggets are detected. Never attempt to operate any large searchcoil too close to heavy salt or extremely negative ground minerals. Maintain an operating height of approximately three to five inches.

OPERATING RECOMMENDATIONS

As you operate and use your Garrett detector, you will quickly grow more proficient in its use. It is recommended that you build your own test plot. Bury several items, including a nail, a piece of foil, a pulltab, a bottlecap and several coins at depths of about two to eight inches and a foot apart. Clearly mark the location where each article is buried. Practice scanning the targets while listening to and studying the detection signals.

Remember that newly buried objects, especially coins, will be somewhat more difficult to detect than items that have been buried for some time. This is primarily a metallurgical phenomenon. Experiment with the various operating modes to see how your detector responds. Practice trying to pinpoint and locate targets precisely.

When scanning, **do not hurry**. Scan the searchcoil at a speed of about one to two feet per second. Keep the searchcoil flat and level to the ground. Move it back and forth slowly and steadily while you walk at a pace that is comfortable. Be methodical. Do not skip any areas. Wear headphones for greater sound perception and concentrate on your scanning.

After you have operated your Scorpion Gold Stinger for only a short time, you will be surprised at how proficient you have become in its use. Do not expect to achieve the greatest accuracy and success, however, until you have operated the detector for at least 100 hours or more.

Good hunting!

MAINTENANCE

- ❖ Always remember that your Garrett detector is a sensitive electronic instrument. It is built to withstand rugged treatment in the outdoors, but you should always handle the detector as carefully as possible.
- ❖ Try to avoid temperature extremes as much as possible, such as storing the detector in an automobile trunk during hot summer months or outdoors in sub-freezing weather.
- ❖ Keep your detector clean. Always wipe the housing after use, and wash the coil when necessary. Protect your instrument from dust and sand as much as possible.
- ❖ Your searchcoil is submersible. The control housing is **not!** *Never* submerge the control housing and *always protect it* from heavy mist, rain or blowing surf.
- ❖ Disassemble the stem and wipe it clean after use in sandy areas.
- ❖ When storing longer than about one month, remove batteries from the detector.

REPAIR SERVICE

In case of difficulty, read this Owner's Manual again thoroughly to make certain your detector is not inoperable needlessly. Your dealer may also be able to offer advice.

When your detector must be returned to the factory for service, always include a letter that describes its problem as fully as possible. Before you return your detector to the Garrett factory, make certain:

- ❖ You have read this Owner's Manual carefully
- ❖ You have checked batteries, switches and connectors. (Check *batteries* especially closely. They are the most common cause of detector "failure".)
- ❖ You have checked with your dealer, particularly if you are not familiar with this type of metal detector.
- ❖ You have included a note with the detector describing the problems you are encountering with this detector and conditions under which they occur. Make certain to include your name, address and a phone number where you can be contacted between 8:30 a.m. and 4 p.m., Central Time.

- ❖ You have carefully packed the detector in its original shipping carton or other suitable box. Make certain that proper insulation or packing material is used to keep all parts secure. Do *not* ship stems or headphones unless they are part of the problem. Be certain to return all coils, unless the problem is mechanical.
- ❖ Ship to Garrett Metal Detectors, 1881 W. State St., Garland, TX 75042.
- ❖ You can call Garrett's Customer Service Department (972-494-6151) if you have further questions.
- ❖ Please allow approximately one week for Garrett technicians to examine and repair your detector after they receive it, plus another week for return shipping to you. All equipment will be returned UPS or parcel post unless written authorization is given by you to ship collect by air parcel post, UPS Blue (air) or air freight.

MIND YOUR MANNERS

Filling holes and obeying *no trespassing* signs are but two requirements of a dedicated metal detector hobbyist. A sincere request that Charles Garrett makes to every user of one of his detectors is that each place searched be left in a better condition than it was found. Thousands of individuals and organizations have adopted this formal Metal Detector Operators Code of Ethics:

- ❖ I will respect private and public property, all historical and archaeological sites and will do no metal detecting on these lands without proper permission.
- ❖ I will keep informed on and obey all laws, regulations and rules governing federal, state and local public lands.
- ❖ I will aid law enforcement officials whenever possible.
- ❖ I will cause no willful damage to property of any kind, including fence, signs and buildings and will always fill holes I dig.
- ❖ I will not destroy property, buildings or the remains of ghost towns and other deserted structures.
- ❖ I will not leave litter or uncovered items lying around. I will carry all trash and dug targets with me when I leave each search area.
- ❖ I will observe the Golden Rule, using good outdoor manners and conducting myself at all times in a manner which will add to the stature and public image of all people engaged in the field of metal detection.

WARNING!

Any metal detector may discover underground power lines; explosives or other items which when struck could cause personal injury. When searching for treasure with your Scorpion Gold Stinger, observe these precautions:

- ❖ Do not hunt in an area where you believe there may be shallowly buried underground electric lines or pipes.
- ❖ Do not hunt in a military zone where bombs or other explosives may be buried.
- ❖ Avoid striking any line known to be or suspected to be carrying electrical power.
- ❖ Do not disturb any pipeline, particularly if it could be carrying flammable gas or liquid.
- ❖ Use reasonable caution in digging toward *any* target, particularly in areas where you are uncertain of underground conditions.

PATENT PROTECTION: Proof of Garrett's excellence is the recognition given them by the following United States patents: 4,709,213; 4,488,115; 4,700,139; 4,398,104; 4,423,377; 4,303,879; 4,334,191; 3,662,255; 4,162,969; 4,334,192; 5,148,151; 5,138,262; 5,721,489; 5,786,696; 5,969,528; Design 274,704 and 297,221; Design 333,990; G.B. Design 2,011,852; Australia Design 111,674 and other patents pending.
